Is (p)rehabilitation effective for men undergoing prostatectomy?

Clare Bourne & Jenny Constable Pelvic Physiotherapists - SIX Physio

Objectives

- Facts & figures
- Surgery overview
- Signs & symptoms
- Prehab, including evidence
- Rehab, including evidence
- Conclusion
- Questions

Facts & Figures

- Prostate cancer is the most common cancer in men.
- Over 47,000 men are diagnosed with prostate cancer every year that's 129 men every day.
- Every 45 minutes one man dies from prostate cancer that's more than 11,000 men every year.
- 1 in 8 men
- 1 in 4 black men
- Increased risk over age 45
- Over 330,000 men are living with and after prostate cancer
- 4500 RRP carried out annually
- Incidence of SUI following RRP 87%
- Incidence of ED is 100% at 1/12 post-op

Brief surgery overview

- The most common surgery carried out is radical retropubic prostatectomy (RRP)
- Some hospitals will use **robotic** assisted surgery (also know as da Vinci surgery)
- Research has shown the following benefits to robotic surgery:
 - Less bleeding
 - Less scarring
 - Shorter hospital stay
 - Quicker recovery
- Surgery involves: Removal of the prostate and seminal vesicles
- Nerve sparing surgery is becoming more common but is only possible if the Ca is confined to the prostate

Signs and symptoms

- Urinary incontinence
 - Internal urethral sphincter deficiency & injury
 - Nerve damage
 - Impaired bladder filling sensation
 - **DO**
- Urinary retention
- Erectile dysfunction
- Penile shortening
- Dry orgasm

PREHAB

Assessment

Aim of initial assessment is to obtain a clear baseline of symptoms.

Baseline symptoms have a clear impact on the prognosis of recovery post surgery.

4) Full Hx of **bowel** symptoms

Outcome Measures

Main outcome measures to use pre & post-op are:

1. ICIQ-UI SF (short form)

1. ICIQ-MLUTS (male lower urinary tract symptoms)

1. IIEF-5(15) (International Index of Erectile Function)

Treatment

- 1. Anatomy & Physiology explained
- Pelvic floor model
- Images
- 2. Pelvic floor exercises

- Patel et al (2013) highlighted that prehab provides benefit by allowing the 'understanding of PFM activation in the absence of incontinence & pain.'
- **3. Discussion about pads -** have samples in clinic to show and discuss
- 4. Erectile dysfunction discussion
- 5. Signposting for support Prostate UK

Continence Foundation of Australia 2013

What does the evidence say?

It is mixed...so be prepared!!

Goonewardene et al (2018)

- A **systematic review** looking at the impact of prehab on continence outcomes after prostatectomy
- 9 studies included

CONCLUSION

- Results were 'overwhelmingly in support' of prehab
- 'Strengthening the PFMs significantly improves post prostatectomy urinary incontinence'
- Advisable for all men to undergo pre-op PFMT to maintain normal PF function post-op

Laurienzo et al (2018)

METHOD

- RCT looking at **electrical stimulation** and **PFM training** on muscle strength, urinary incontinence and erectile function
- Follow up pre op, 1,3 and 6 month

RESULTS

- No significant difference between all groups
- All worsening PFM strength immediately post op, plus ED and poor QOL, which shows the impact of surgery on PFM
- All groups improved at 3-6 months

Chang et al (2016)

• Meta-analysis of 11 studies

RESULTS

- 'Significant 36% reduced risk of postop IC at 3/12 after RRP if preop PFMEs were completed'.
- NO significant difference at 1/12 or 6/12
- Found conflicting results between existing evidence into prehab:
 - 6 showed benefit
 - 5 failed to show benefit
 - All small sample size

CONCLUSION

Preop PFME may aid early urinary incontinence recovery and increase QoL

Wang et al (2014)

• Meta-analysis

CONCLUSION: 'additional pre-op PFMT did **NOT** improved the rate of re-establishment of continence after RRP at 1/12, 3/12, 6/12 or 1 year.'

HOWEVER - interpret with caution

- Only 5 studies not enough to draw a strong conclusion from
- Considerable between study heterogenity
 - different durations of pre-op PFMEs
 - o different frequency of exercise

Tienforti et al (2012)

METHOD

- 34 patients who underwent open retropubic RP
- **Pre-op BFB** one 20 minute session
- Monthly visits post-op for intervention group
- Training diaries

CONCLUSION

- 'a **single pre-op** supervised training session with **BFB**, with a postop PFME programme, including FUPT on a monthly basis, is **effective** at improving the **recovery of incontinence** after **open** RP'
- QoL not significant between groups

Patel et al (2013) - Retrospective Analysis

TREATMENT:

- Structure & function of bladder, urethra & PFMs with models & diagrams
- Activate PF in different functional positions
- Transabdominal US for biofeedback

RESULTS:

- Physio guided-PFMT commenced **4 weeks before RRP** significantly reduced severity and duration of incontinence at **6 weeks post surgery**
- Significance of this is **not** shown at **3 months** post surgery

These results support the studies by Centemero et al (2010), Parekh et al (2003), Burgio et al (2006) & Sueppel et al (2001) - all of which had much smaller sample sizes

Use of Real Time Ultrasound (RTUS)

- RTUS provides clear biofeedback and is of clear benefit to this cohort of patients
- Men often struggle to engage their PF alone, commonly showing cocontraction
- Men often report they cannot 'feel much'
- **Doorbar-Baptist (2013)** confirmed that RTUS is **reliable** to use for the assessment and 'attainment of pelvic floor contraction in men with prostate cancer, most effective pre-op'

REHAB

Assessment

- Ideally to be seen once catheter removed (at 2 weeks)
- Similar to pre-op if not seen: this is where the LUTs will be present and ED

- Pick up any red flags
 - \circ Bleeding
 - Frank Haematuria
 - Pain
 - Numbness
 - Faecal Incontinence
- Repeat outcome measures

Assessment

• Depending on pain and time post surgery complete an **ARE** with consent, otherwise use transabdominal or transperineal **RTUS**

- **RTUS:** look at TVA and ensure not bracing abdominals, especially if still struggling with SUI
- Number and type of **pads**

• Establish goals: sports they want to get back to &

job pressures

Treatments

- Best results come from a **MDT approach** good to have connections with the CNS.
- **PFMEs** (individual programme) & **education** about relevance to UI and ED
- Bladder retraining / fluid intake advice
- **Constipation** avoidance
- Pad usage and weaning off protocol Joanne Milios
- Pad protocol : aim dry at night first, once dry 3 nights remove pad
- **Pumps** and **PDE5** i able to be commenced immediately after catheter removal (Patel et al, '13)
- **Pilates** and structured core once not continence reduced

What does the evidence say?

Ribeiro et al 2010

METHOD

- RCT impact of **PFM biofeedback** training on improving continence
- 12 month follow up

RESULTS

- 73% vs 39% at 3 months
- 96% vs 75% continent at 12 months
- Both groups improved
- Use of **regular biofeedback** hastens the recovery of continence

Overgard et al (2008)

AIM

• To assess the effect of intensive and frequent PFMT with and without follow up by a physiotherapist.

RESULTS

- statistical significance in perceived problems .
 - 97% mild UI problems in group A vs 78% in group B
- 6 months Group A 79% continent V 58% group B (clinically relevant)
- 12 months 92% group A vs 72% group B (statistically and clinically)

CONCLUSION

 Post RP follow up by a physiotherapist can increase long term adherence of doing PFMT and therefore improve continence rate

Glazener et al (2011)

METHOD

- 2 RCTS comparing
- 4 sessions of therapy over 3 months vs standard care and lifestyle advice
- 1 year follow up

RESULTS

- 12 months 76% continent vs 77%
- 65% vs 62 % in second trial

CONCLUSION

- No significant difference
- Only 4 sessions
- No true control

Anderson et al (2015) - Cochrane review

- Reviewed 50 trials RCTS or quasi-RCTs
 - Included RRP & TURP
- Considerable variation in interventions, populations & outcome measures

CONCLUSION

- There is no clear support that conservative management of any type is helpful for postprostatectomy UI, whether delivered as treatment to men who are incontinent or as prevention to all men undergoing radical prostatectomy
- Large variation in interventions and follow up
- Low quality studies
- Further rigorous RCTs are still required to obtain a definitive answer

Erectile dysfunction

Why is erectile function is impacted?

- Varied post op outcomes 26-100% will have ED (Burnett et al 2007)
- Neurogenic impact on cavernosal nerves
 - \circ Crush
 - Thermal
 - Severed
- Vascular impact

Further impacts of poor erectile function

- Loss of daily and nocturnal erections (3-6 a night in REM sleep)
- Smooth muscle apoptosis and fibrosis leads to loss of length and circumference
- Most commonly occurs 4-8 months post RP
- Longer men go without erections longer recovery due to above
- Aim to achieve erections early to help prevent the loss of length and circumference due to tissue death
- There is a link between ED and depression

PFM and return of erectile function

- PFM contraction builds on **bulbospongiosus** and **ischiocavernosus** which help increase intracavernosal pressure
- There is also increase in **neurotrophic factors** that help increase vascular endothelial growth factor which can help with the **nerve regeneration**
- Promotes oxygenation and help reduce tissue death in corpora cavernosa
- Link with continence and return to potency

What does the evidence say?

Lin et al (2012)

METHOD

- Looking at effects of **PFMT** on the return of sexual function following RRP
- Taught PFMEs daily from catheter removal vs control group started at 3/12 post op

RESULTS

• Significant difference at 6 and 12 months in IIEF scores

Prota et al (2012)

METHOD

- An **RCT** looking at the effects of pure **PFM training** and **return to potency**.
- Treatment group given weekly **biofeedback** for 12/52s
- Control group verbal info on PFM

RESULTS

- At 12 months 47% potent vs 12.5% control
- Link with continence and ED function
- Neither group given PDEi-5s

Conclusion

Prehab vs Rehab

PRE vs POST rehab for UI and ED

- Research provides a mixed picture
- Best outcomes:
 - Combination of prehab and rehab
 - Longer period of prehab
- In the majority of cases PFMEs:
 - Shorten the length of time to being continent
 - **Reduce** number of **pads**
 - Improve erectile function
- Ideally patients are taught by **specialist physiotherapist** & follow up until continent
- Both slow and fast twitch exercises daily

Key points for future service development

Key points for future

- In both NHS and Private settings the **best people** to **contact** are:
 - GPs in area do they know about ED and UI following RRP and what they can offer
 - CNS in hospitals,
 - Reps for devices (MEDIcare) they can educate you and do home visits for patients
- Follow ups are important to monitor return to sport/ function/ work as many men are younger now and needing to get back to higher levels of function

A little bit extra on pumps...

Pumps

Should be used daily, aim to achieve 20 engorgements a day this can be in 1 10 mins session or 2 5 mins sessions

POSITIVES

- Promotes early function
- Reduced loss of length and circumference
- Can be used once healing occurred (average 3.9weeks post surgery)

NEGATIVES

- Bulky
- Bruising
- Urinary leakage can happen if this has not been regained
- Cold / numb feeling in penis
- Difficult to get seal
- Interrupt mood
- Time consuming

Raina et al (2016)

Investigated the early use of VCDs following RRP. In both NS and NNS

METHOD

- 109 men aged 50-71
- VCD used daily, ring only applied for full penetration

RESULTS AT 9 MONTHS

- 80% patients successfully used VCD with ring for penetration
- 32% report natural erections (52% of these able to achieve vaginal penetration)
- 23% vs 85% loss of length and circumference(VCD vs non VCD)
- IIEF scores raised 4.8 to 16 after VCD
